

# Dexmedetomidine in OB Anesthesia Systemic application

PD Dr. med. Pascal Vuilleumier  
ICU Lucerne, LUKS

# Disclosures

- I have never used dexmedetomidine in OB anesthesia
- Currently I am working in the ICU and I am not representing the views of the department of Anesthesia of the LUKS

# Agenda

Why Dexmedetomidine?  
Some general basics

Safety first

Dex in procedures related  
to general anesthesia

Dex in procedures related  
to analgosedation

Final considerations

**Why dexmedetomidine ?**

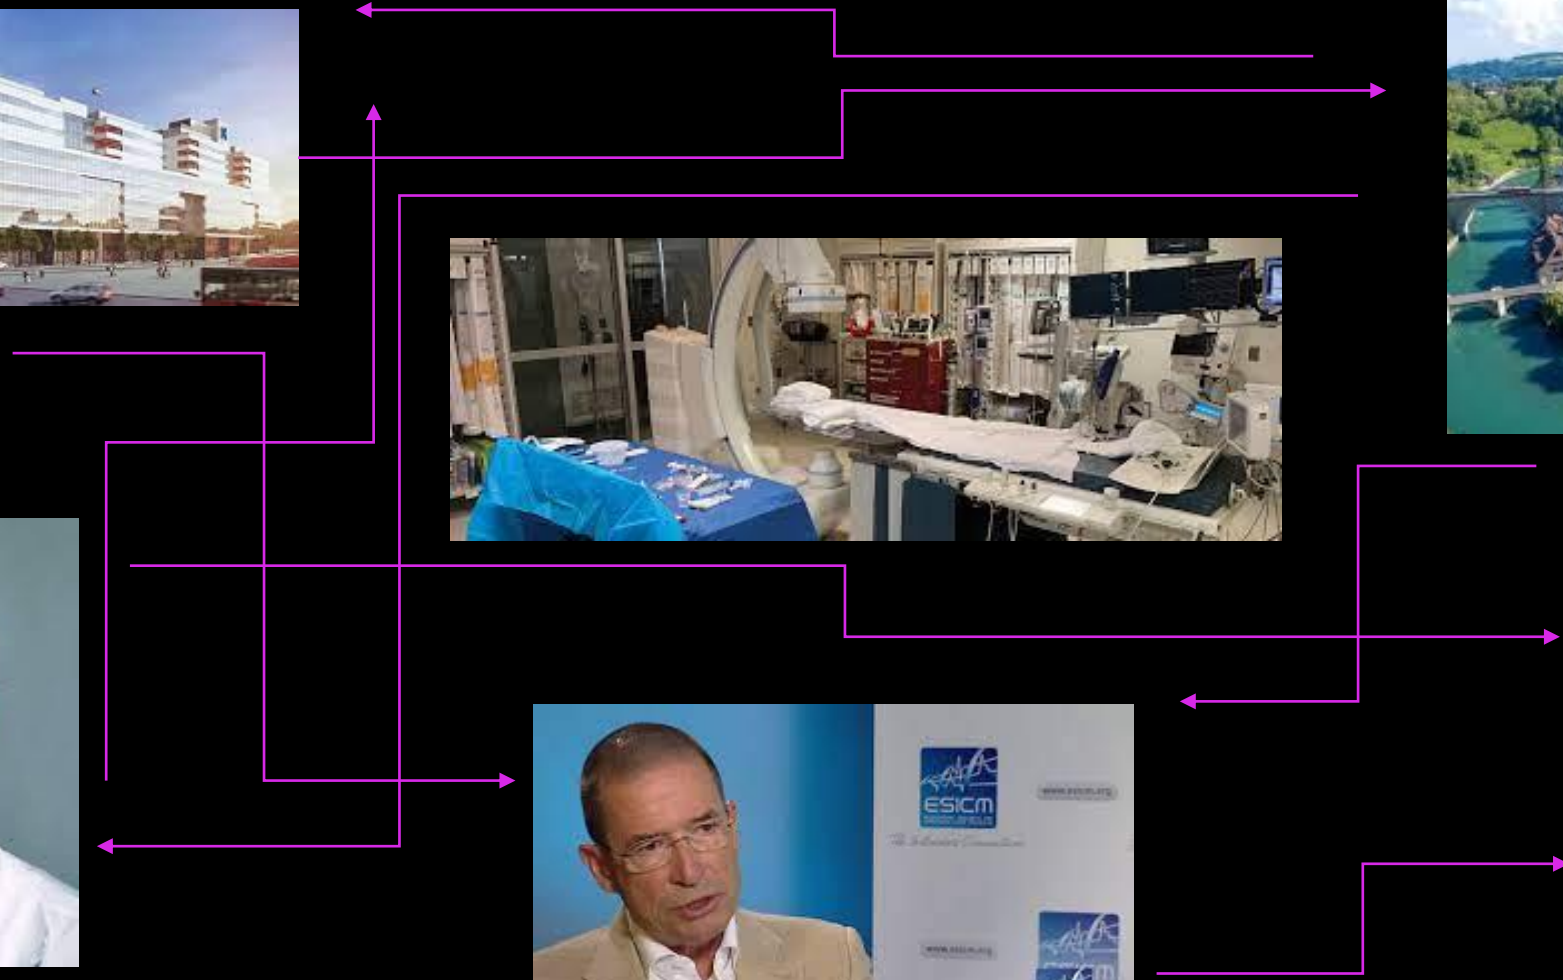

## Some historical facts

- 1999: FDA-approval for sedo-analgesia < 24h
- 2011: EMA-approval first for sedo-analgesia in the ICU, secondarily also for procedural sedo-analgesia by anesthesiologists

# My «history», approx. 2011:

### Noxious Stimulation Response Index

#### *A Novel Anesthetic State Index Based on Hypnotic-Opioid Interaction*

Martin Luginbühl, PD Dr. med.,\* Peter M. Schumacher, M.Sc., Ph.D.,† Pascal Vuilleumier, M.D.,‡ Hugo Vereecke, M.D., Ph.D.,§ Björn Heyse, M.D.,§ Thomas W. Bouillon, PD Dr. med.,|| Michel M. R. F. Struys, M.D., Ph.D.¶

**ABSTRACT**  
**Background:** The noxious stimulation response index (NSRI) is a novel anesthetic depth index ranging between 100 and 0, computed

0.85), and 0.70 (0.54–0.84), respectively. The  $P_{50}$  of effect-site propofol concentration, BIS, and AAI for observer assessment of alertness and sedation score and loss of eyelash reflex were be-

### Anesthesia or sedation for gastroenterologic endoscopies

Martin Luginbühl, Pascal Vuilleumier, Peter Schumacher and Frank Stüber

Department of Anaesthesiology, University Hospital of Bern, Bern, Switzerland **Purpose of review**

**Non-operating room anesthesia:  
Ketofol: Propofol-Ketamine 10 ml/kg/h.....**

**WARNING  
TO TOURISTS  
DO NOT LAUGH  
AT THE NATIVES**

- Systemic application in general anesthesia:
  - Co-analgesia in patients without locoregional catheter for painful procedures
  - Chronic pain patients
  - Patients with chronic opiate use or abuse
- NORA: Sedo-analgesia in ASA III-IV patients
- TAVI's

## Adrenergic receptors

$\alpha 1$ : (nor)adrenaline, phenylephrine..

$\alpha 2$ : clonidine, dexmedetomidine

# PK/PD

Clonidine is a  $\alpha_2$ -adrenergic receptor ( $\alpha_2$ -AR) agonist with a 220:1 ratio of  $\alpha_2$ :  $\alpha_1$  receptor affinity

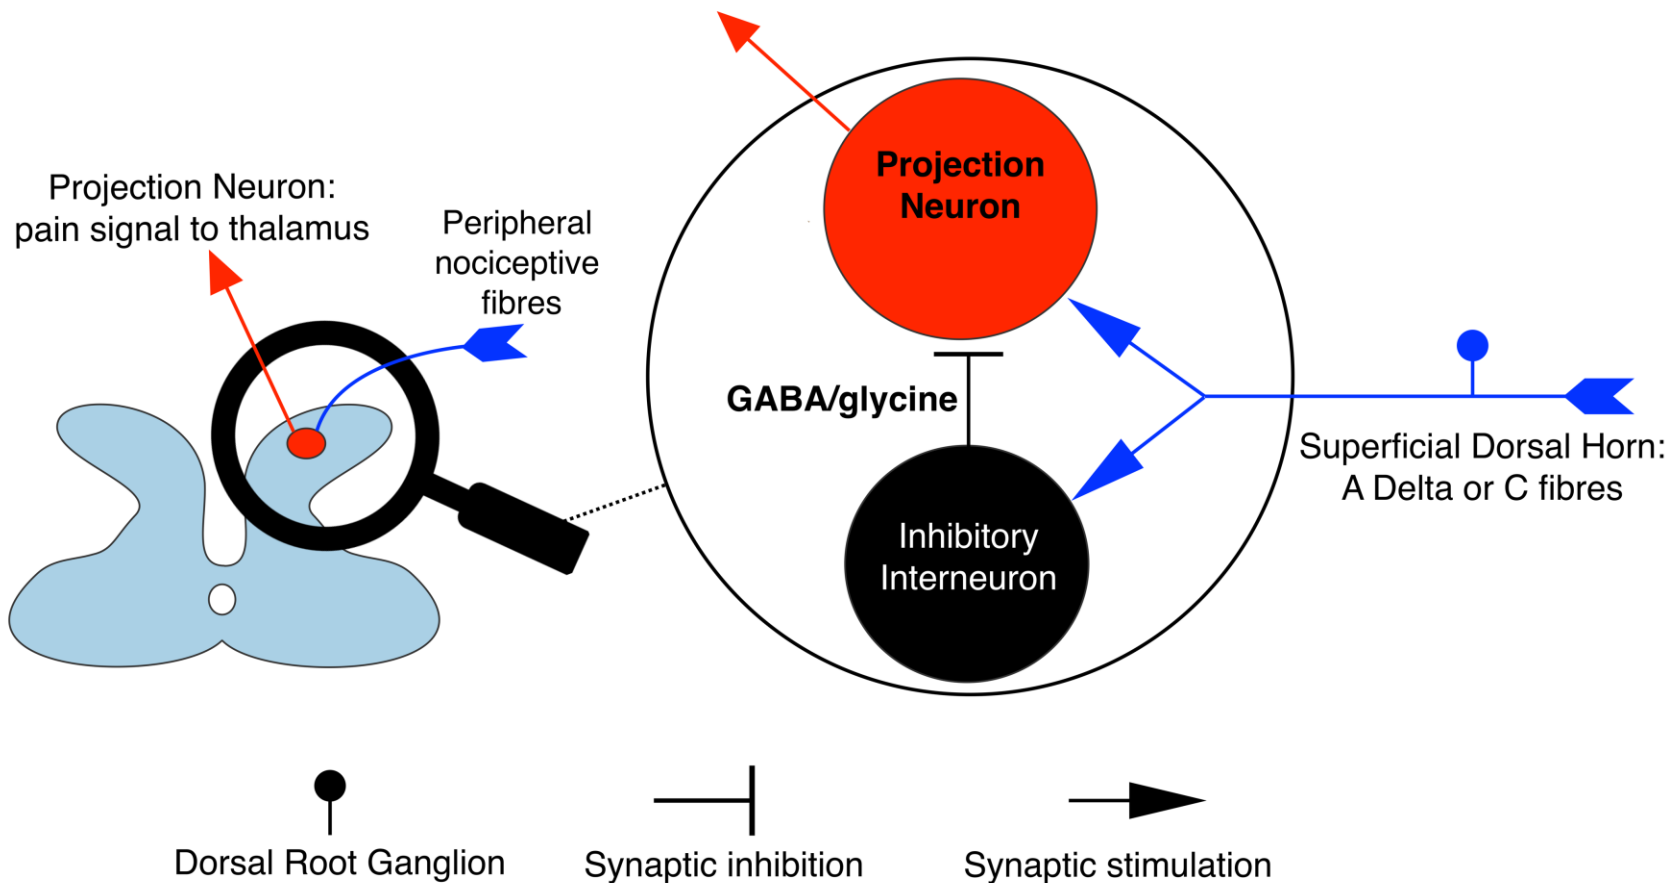

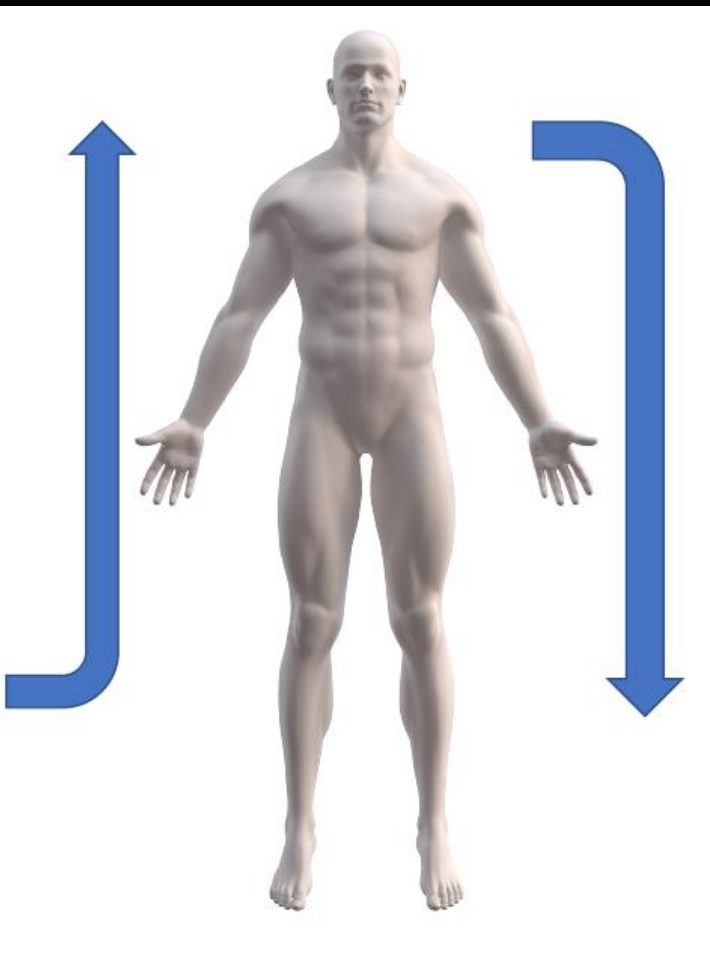

$\alpha_1$ -AR activity is countersteered by the  $\alpha_2$ -AR. The higher the  $\alpha_2$ -AR affinity, the stronger the analgesic and sedative effect.

Dexmedetomidine's receptor affinity with a 1620:1  $\alpha_2$ :  $\alpha_1$  ratio (8~10 times stronger compared to clonidine)

# PK/PD

A

B

# Obstetric use: Safety first

On Dec. 14, 2016, the US Food and Drug Administration issued a warning regarding impaired brain development in children following exposure to certain anesthetic agents used for general anesthesia, namely the inhalational anesthetics isoflurane, sevoflurane, and desflurane, and the intravenous agents propofol and midazolam, in the third trimester of pregnancy. Furthermore, this warning recommends that health care professionals should balance the benefits of appropriate anesthesia in young children and pregnant women against potential risks, especially for procedures that may last >3 hours or if multiple procedures are required in children <3 years old.

*Olutoye et al., AJOG 2017*

# Dexmedetomidine ?

FDA category C medication:

Drug with little evidence for their safety in animals, humans or both

- Degree of placental transfer 0,68-0,76 (maternal/fetal index): less than remifentanil and clonidine
- Dexmedetomidine is fat soluble and retained in the placenta
- Increased uterine contractility in the gravid rat myometrium
- However reduced oxytocin-induced contractions in the rat myometrium
- However there is very limited in-vivo information

**What is  
known  
about safety**

# Intravenous dexmedetomidine for obstetric anesthesia: Brainstorming possible benefits:

- Opiate sparing
- Minimal respiratory depression with sedation
- Blunting hemodynamic responses to stress and pain
- Anti-hypertensive
- Blunting opiate-induced hyperalgesia
- Better control of dose-response than clonidine
- Treatment of a shivering parturient

# Hemodynamics and stress, N=68,

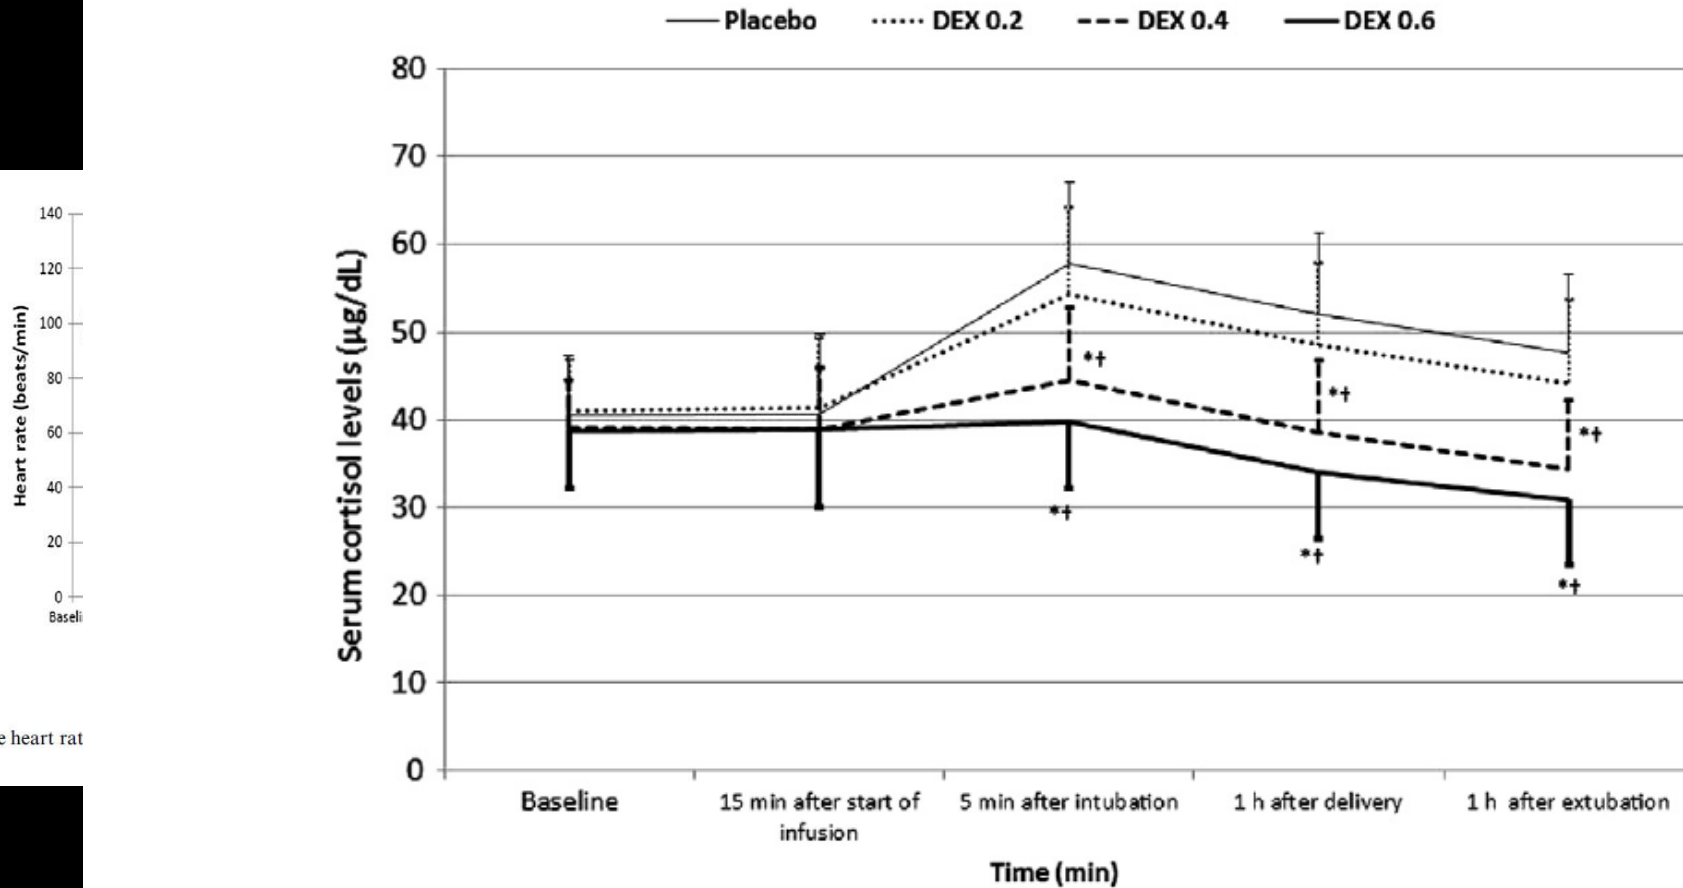

Fig. 3 Perioperative serum cortisol levels. Data are mean  $\pm$  SD.  $P < 0.008$  compared with the \* placebo and †DEX 0.2 groups.

Fig. 1 Perioperative heart rate  
†DEX 0.4 group.

compared with the \* placebo

	Placebo ( <i>n</i> = 17)	DEX 0.2 ( <i>n</i> = 17)	DEX 0.4 ( <i>n</i> = 17)	DEX 0.6 ( <i>n</i> = 17)
<b>MAC-Sevo</b>				
after intubation	0.72 ± 0.05	0.65 ± 0.16	0.41 ± 0.17*†	0.38 ± 0.17*†
15 min after delivery	0.64 ± 0.14	0.57 ± 0.14	0.38 ± 0.11*†	0.36 ± 0.09 *†
30 min after delivery	0.66 ± 0.09	0.57 ± 0.13	0.36 ± 0.10*†	0.35 ± 0.12*†
VAS assessment of uterine relaxation	4 [2–4]	3 [2–3]	2 [1–3]*	1.5 [1–2]*†
Supplementary oxytocin (IU)	20 [10–30]	10 [10–15]*	10 [10–15]*	10 [10–10]*
Time to spontaneous ventilation (min)	4.94 ± 1.66	5.1 ± 1.25	4.8 ± 2.04	5.5 ± 2.24
Time to extubation (min)	8.3 ± 2.02	7.5 ± 1.59	7.4 ± 2.41	8.8 ± 2.62
Quality of tracheal extubation	4 [1–5]	2 [1–3]*	1 [1–3]*	1 [1–3]*
<b>Sedation score</b>				
5 min	1 [1–3]	1 [1–3]	1.5 [1–3]	2 [1–3]*†
15 min	1 [1–1]	1 [1–2]	1 [1–1]	2 [1–2]*†

60 min	1 [1–1]	1 [1–1]	1 [1–1]	1 [1–1]
Patients experiencing PONV	4 (23.5%)	1 (5.9%)	0*	0*

Data are mean ± SD, median [range] or number (%). VAS: visual analog scale; PONV: postoperative nausea and vomiting. *P* < 0.05 compared with \*placebo and †DEX 0.2.; MAC-Sevo, minimum alveolar concentration of sevoflurane; VAS, visual analog scale; PONV, postoperative nausea and vomiting.

# Preeclampsia and CS in GA N=36

## Measurements

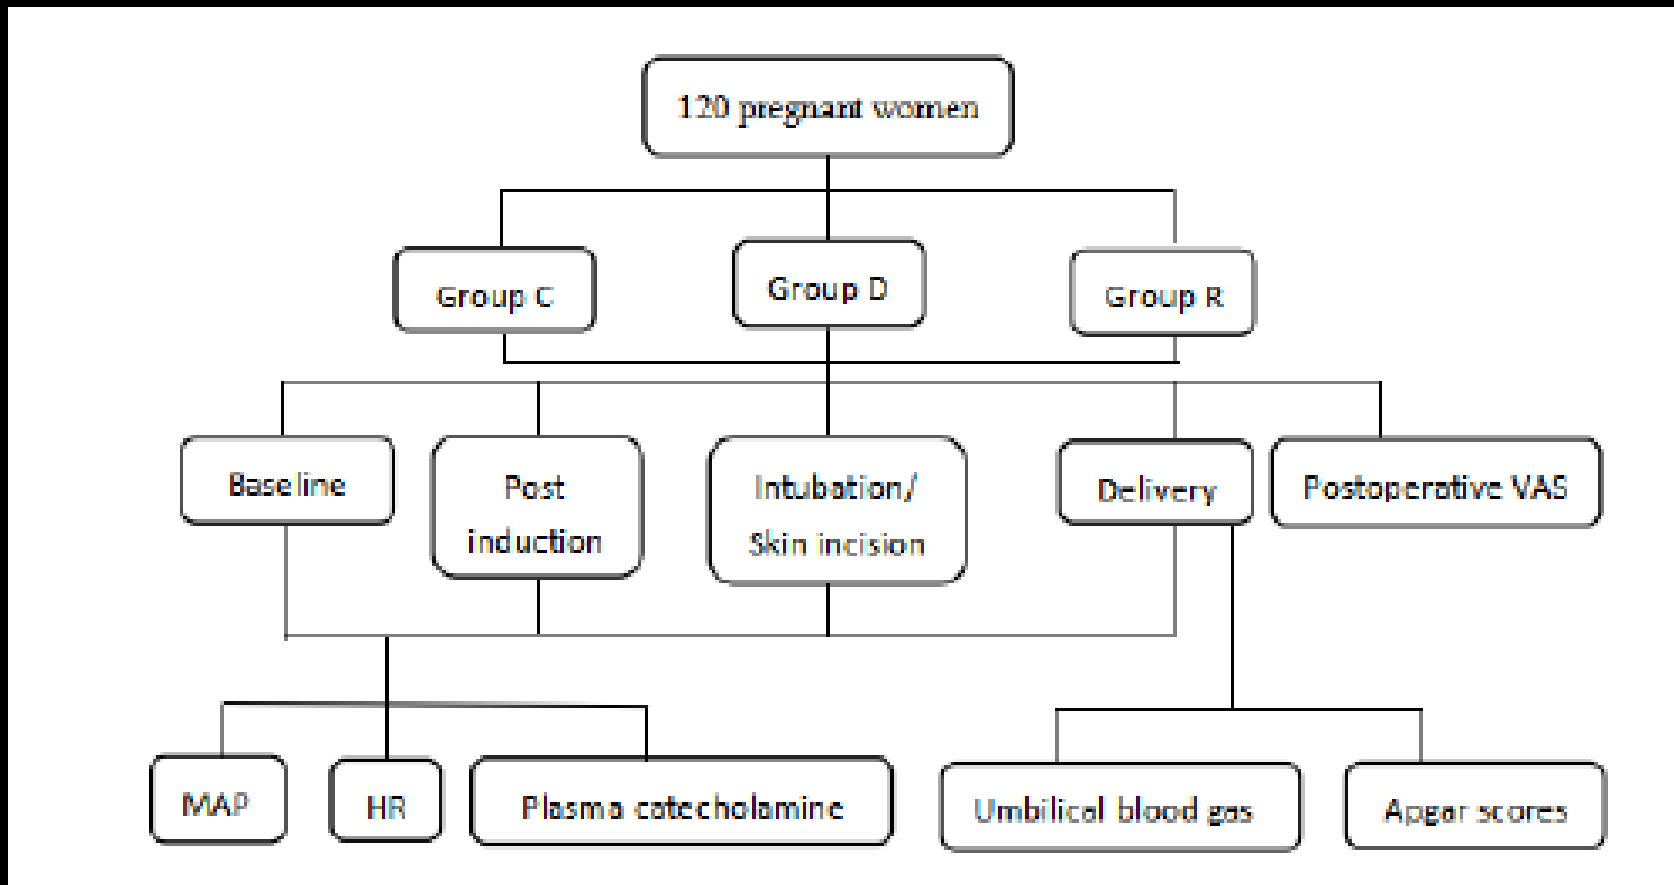

## er CS

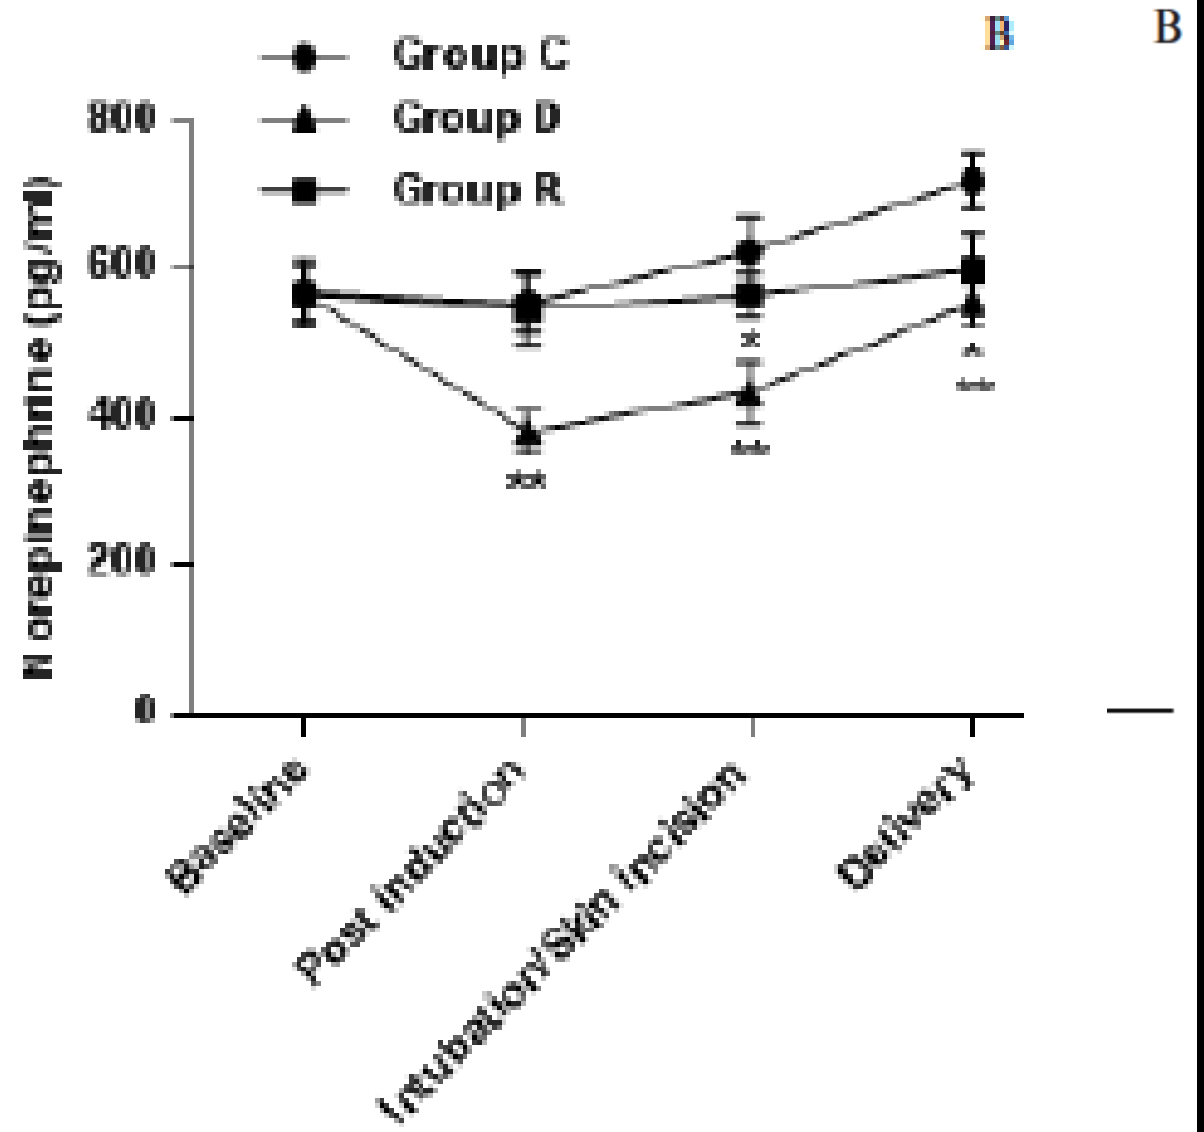

# Dexmedetomidine vs. Remifentanyl in GA

## N=120

**Table 2.** Maternal postoperative VAS and total tramadol consumption.

	Group C (n = 40)	Group R (n = 40)	Group D (n = 40)	<i>P</i>
Postoperative VAS				
1h	5.2±1.13	4.9±1.07	1.9±0.89*	<0.001
2h	4.4±1.10	4.3±1.05	3.2±1.06*	<0.001
3h	3.6±1.08	3.4±1.12	3.3±1.23	0.493
Total tramadol consumption (mg)	152±18.0	146±21.0	80±22.0*	<0.001

\**P*<0.05 compared with the control and remifentanil groups. Values are presented as the mean ± standard deviation.

# Other uses in Obstetric Anesthesia/Analgesia?

- Remifentanyl PCA – Antihyperalgesic effect
- IVF – Analgesia and sedation for oocyte retrieval
- Analgosedation for intrauterine procedures (Laser for FFTS, placement of drains)

# A case report first..from Brigham Women's Hospital

- 31 yo parturient with a spina bifida for induction of labor
- @ 3 cm dilatation start of a "standard" Fentanyl iv PCA, bolus 13 mcg/lockout 3 minutes
- Over a period of 12 h uncontrollable pain, refuses more opiates and refuses a CS
- Bolus dose of 0.5 mcg/kg followed by 0.2 mcg/kg/h with a VAS reduction from 9 to 2/10, however gradually increased to 0.6 mcg/kg/h
- 16 hours later -> chorioamnionitis -> CS
- Dexmedetomidine continued during the CS

# Courageous

- Hemodynamics stable
- Healthy baby, APGAR 7/8/10
- Uneventful maternal outcome, normal postoperative analgesic needs
- Mother happy and desires the same “drugs” for the next baby

# Double blind combination of remifentanil and dexmedetomidine N=60

- Group I: Remifentanil 0.25 mcg/kg, lockout 2 min,  
with Bolus Dexmedetomidine 1 mcg/kg followed by  
0.5 mcg/kg/h
- Group II: Remifentanil 0.25 mcg/kg, lockout 2 min

**Figure 1:** Visual analog scale pain score; data are expressed as mean  $\pm$  standard deviation

More desaturations in the remi mono group

More nausea and vomiting in the remi mono group

Less remifentanyl consumption in the combined group

Higher maternal satisfaction in the combined group

Not significant: Hemodynamics, CS conversion rate, foetal outcomes, nonreassuring FHR

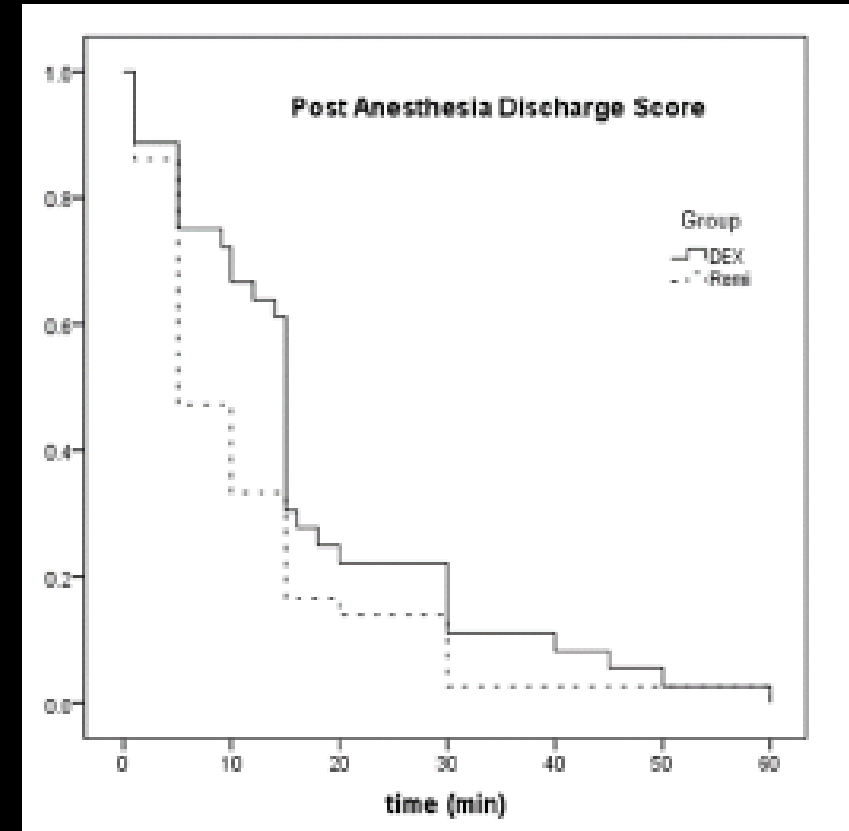

# RCT, N=60, Dexmedetomidine vs Midazolam

Variable	Group (D) (n=26)	Group (M) (n=26)	P
VAS			
At 0 time	43.68±13.18	47.84±13.77	0.14 NS
At 5 min	40.32±12.38	47.68±14.8	0.03*
At 10 min	39.92±12.88	49±14.15	0.01*
At 15 min	43.08±12.49	47.44±13.39	0.11 NS
At 20 min	42.04±11.51	46.88±12.95	0.08 NS
At 25 min	35.24±10.99	39.88±12.45	0.08 NS
Amount of rescue propofol (mg) Median (range)	55 (20-100)	150 (100-250)	<0.01†

# Comparison of dexmedetomidine and fentanyl vs midazolam and remifentanyl

Endpoint: Propofol rescue and IVF success  
N=72

Physician satisfaction  
(Gynecologist): NS

Dexmedetomidine: More  
propofol rescue needed

Dexmedetomidine: 10  
more minutes to discharge

Oocytes: Better quality @  
day 3 in the Dex group

IVF outcome parameters  
similar in both groups

Let's wrap it up

## Pro's

- ✓ General Anesthesia:
  - Antihypertensive
  - Sedative
  - Uterine contraction maintained
  - Postoperative analgesia
- ✓ Obstetric Analgesia:
  - Opiate sparing
  - Maternal satisfaction
  - PONV-rates lower
- ✓ Oocyte retrieval
  - No effect on oocytes or fertilization rate
  - Equivocal propofol rescue needed (depending on comparator)

## Con's

- ✗ Off label
  - Unknown effect on foetus
  - Maternal hypotension/bradycardia
- ✗ Unknown effect on foetus
- ✗ Data very limited concerning fertilization rate
  - Data very limited on effect on oocytes

Until further notice  
Off-label use  
Studies performed up to date somewhat..  
Large studies needed for safety

**Questions?  
Thank you**
